

FUNCTIONALITY TESTING AND MAINTENANCE

MPE offer to clients various levels of filter functionality testing and maintenance of installed electrical filters. These services include but are not limited to:

- Bronze** Powered up visual inspection and basic functionality checking of filters with no interruption of service. Single page report is provided recording current status of filter; recommendation for any more detailed or remedial maintenance requirements and recommendation for future maintenance schedule.
- Silver** Powered down visual and physical inspection of filters including basic circuit integrity check; health assessment and recording of integrated surge arrestor status. Single page report is provided recording current filter status including surge arrestor log data; recommendation for any more detailed or remedial maintenance requirements and recommendation for future maintenance schedule.
- Gold** As per silver but with the addition of preventative replacement of surge arrestors identified as having degraded so as to be at risk of future failure. Single page report is provided recording current filter status including new surge arrestor data; recommendation for any more detailed or remedial maintenance requirements and recommendation for future maintenance schedule.

Other specialist on site testing and pre compliance testing at MPE is also available.

Upon completion of any of the above works, MPE will restore inspected filters and work areas back to their pre inspection operational standard unless to do so would provide issues of a personnel health and safety nature.

TESTING AND MAINTENANCE TRAINING

Training is provided regarding basic visual and physical filter inspections along with the health assessment and replacement of integrated surge arrestors. In addition, trainees will be advised of any current applicable standards which should be adhered to or considered. This training can be provided at MPE site or client site.
